

Treatment of Calcaneus Necrosis Bone Filling with

Graftys® QUICKSET Bone Void Filler

Patient: 22 years old female

Case Presentation

Intervention of Dr. Sebastien Parratte on a calcaneus necrosis. 9 months after a talus fracture treated with a cast, the patient presents spontaneous pain and osteonecrosis, with extra-articular lesion of the talus and a defect of the greater tuberosity of the calcaneus.

Treatment

The surgical plan consists on grafting of the osteochondral lesion of the talus and injection of Graftys® QuickSet in the calcaneus tuberosit.

Outcome

- 2 months later the scan showed fracture healing;
- After 6 months, the calcaneus is pain free and a very good bony integration is observed.

Pre-operative x-ray

Surgery

Immediate post-operative Scans

6 months follow-up x-rays
